Assignment 1 :

1) explain the difference b/w python 1, python 2, python 3 ?

Difference Between Python 1, Python 2, and Python 3

Python has evolved through several major versions. Python 1 introduced the language's core features, Python 2 added improvements, and Python 3 introduced important changes to make the

Python 1

- Released in 1994.
- Established the basic features of Python.
- Supported functions, modules, exception handling, and core data types.
- Was designed to make programming readable and straightforward.
- It is now obsolete and no longer used for modern development.

Example:

```
print "Hello World"
```

Python 2

- Released in 2000.
- Introduced improvements such as list comprehensions and better garbage collection.
- Supported print as a statement.
- Used integer division when both operands were integers.
- Python 2 reached the end of its official support on January 1, 2020.

Example:

```
print "Hello World"
print 5 / 2  # Output: 2
```

python 3

- Released in 2008.
- Introduced changes that made the language more consistent.
- Uses print() as a function.
- Uses Unicode strings by default.
- The / operator performs true division, while // performs floor division.
- Supports modern features such as f-strings and type annotations.
- It is the recommended version for new Python projects.

Example:

```
print("Hello World")
print(5 / 2)   # Output: 2.5
print(5 // 2)  # Output: 2
```
